HACCP-Evaluation Stokoderm® Aqua PURE

When skin protection and skin care products are used in the food industry it cannot be excluded that traces of the products are transferred to food. These traces should not have an adverse effect on the quality of foodstuffs. To prove the suitability of STOKODERM® Aqua PURE for use in food environments, the product has been assessed by a sensory test and a toxicological evaluation following the HACCP concept.

1. Using a triangle-test (No. TES-S-004 British Standard, Sensory Analysis – Methodology Triangel Test BS EN ISO 4120:2007, Campden BRI, Gloucestershire/UK) it was evaluated, if transfer of the product by hands will influence the taste of foodstuffs. The expert report (Report number S/REP/139171/1, May 2016) concludes "The test results above indicate that the leave on cream under test Stokoderm® Aqua Pure does not have the potential to taint when tested as above.
2. The report about the evaluation of the oral toxicity from Delphic HSE Solutions Ltd. (Deeput, UK) point out: "If incidentally swallowed in small amounts, the formulation as supplied is unlikely to cause any adverse effects. Not expected to produce systemic toxicity following ingestion" (Report 13246-1-22938).

Conclusion: Stokoderm® Aqua PURE will not have negative influence on foodstuffs when applied according recommended instructions for use.
